

MOTHERS WHO ARE INTERESTED IN THEIR INFANT'S EMOTIONAL DEVELOPMENT

Does infant temperament affect responses to maternal attention?

We are studying infants' emotional responses to maternal attention and inattention.

Help us find out about this important topic by participating in a fun research study with your infant when they are between the ages of 5 and 15 months old!

- Learn about maternal-infant relationships
- Engage in a unique parent-infant activity
- Assist in learning about infant emotions

Participation is simple and includes the following:

- Engage in a fun session with your infant
 - Play with your infant in our lab
 - Engage in some simple tasks
- Complete some short questionnaires about:
 - Your mood
 - Your approach/withdrawal style
 - Your infant's behaviors
 - Basic demographic information

For participation, your infant will receive a small gift and you will receive a Research Participant Certificate to keep as a memento for assisting in the furthering of knowledge about infant emotional development.
